Table of contents

1. HMW 4 - Keys
2. A few notes from the assignment
3. Q&A
4. RD Challenge

HMW 4 - Keys

A few notes from the assignment

Independent Samples and Paired Samples T-tests

- **The One Sample T-Test** determines whether the sample mean is statistically different from a known or hypothesized population mean. The One Sample t Test is a parametric test.

Independent Samples and Paired Samples T-tests

- **The One Sample T-Test** determines whether the sample mean is statistically different from a known or hypothesized population mean. The One Sample t Test is a parametric test.
- Example: IQ

Independent Samples and Paired Samples T-tests

- **The One Sample T-Test** determines whether the sample mean is statistically different from a known or hypothesized population mean. The One Sample t Test is a parametric test.
- Example: IQ
- **An Independent-Samples T-Test** compares two sample means from different populations regarding the same variable to determine whether the difference between the two means is statistically significant or occurred by chance alone.

Independent Samples and Paired Samples T-tests

- **The One Sample T-Test** determines whether the sample mean is statistically different from a known or hypothesized population mean. The One Sample t Test is a parametric test.
- Example: IQ
- **An Independent-Samples T-Test** compares two sample means from different populations regarding the same variable to determine whether the difference between the two means is statistically significant or occurred by chance alone.
- Examples: Guinness Batches, Rents in North and South Dublin in a given year. Others?

Independent Samples and Paired Samples T-tests

- **The One Sample T-Test** determines whether the sample mean is statistically different from a known or hypothesized population mean. The One Sample t Test is a parametric test.
- Example: IQ
- **An Independent-Samples T-Test** compares two sample means from different populations regarding the same variable to determine whether the difference between the two means is statistically significant or occurred by chance alone.
- Examples: Guinness Batches, Rents in North and South Dublin in a given year. Others?
- **A Paired Samples T-Test** (or *Dependent Samples T-test*) compares two sample means from the same population regarding the same variable at two different times such as during a pre-test and post-test to determine whether the difference between the two means is statistically significant or occurred by chance alone.

Independent Samples and Paired Samples T-tests

- **The One Sample T-Test** determines whether the sample mean is statistically different from a known or hypothesized population mean. The One Sample t Test is a parametric test.
- Example: IQ
- **An Independent-Samples T-Test** compares two sample means from different populations regarding the same variable to determine whether the difference between the two means is statistically significant or occurred by chance alone.
- Examples: Guinness Batches, Rents in North and South Dublin in a given year. Others?
- **A Paired Samples T-Test** (or *Dependent Samples T-test*) compares two sample means from the same population regarding the same variable at two different times such as during a pre-test and post-test to determine whether the difference between the two means is statistically significant or occurred by chance alone.
- Example: Pre-module vs Post-module test score

Experiments vs Quasi-Experiments

Experiments:

- High degree of control

Experiments vs Quasi-Experiments

Experiments:

- High degree of control
- Experimental group receives the stimulus or "treatment"

Experiments vs Quasi-Experiments

Experiments:

- High degree of control
- Experimental group receives the stimulus or "treatment"
- Control group

Experiments vs Quasi-Experiments

Experiments:

- High degree of control
- Experimental group receives the stimulus or "treatment"
- Control group
- Random assignment to groups:

Experiments vs Quasi-Experiments

Experiments:

- High degree of control
- Experimental group receives the stimulus or "treatment"
- Control group
- Random assignment to groups: **this control for other factors that may influence the DV**

Experiments vs Quasi-Experiments

Experiments:

- High degree of control
- Experimental group receives the stimulus or "treatment"
- Control group
- Random assignment to groups: **this control for other factors that may influence the DV**

Steps:

- t_1 : Pre-tests

Experiments vs Quasi-Experiments

Experiments:

- High degree of control
- Experimental group receives the stimulus or "treatment"
- Control group
- Random assignment to groups: **this control for other factors that may influence the DV**

Steps:

- t_1 : Pre-tests
- t_2 : Stimolous for the treatment-group

Experiments vs Quasi-Experiments

Experiments:

- High degree of control
- Experimental group receives the stimulus or "treatment"
- Control group
- Random assignment to groups: **this control for other factors that may influence the DV**

Steps:

- t_1 : Pre-tests
- t_2 : Stimolous for the treatment-group
- t_3 : Post-test

Experiments vs Quasi-Experiments

Experiments:

- High degree of control
- Experimental group receives the stimulus or "treatment"
- Control group
- Random assignment to groups: **this control for other factors that may influence the DV**

Steps:

- t_1 : Pre-tests
- t_2 : Stimolous for the treatment-group
- t_3 : Post-test
- Pre-tests further reduce the risks of extraneous factors influencing the results

Experiments vs Quasi-Experiments

Experiments:

- High degree of control
- Experimental group receives the stimulus or "treatment"
- Control group
- Random assignment to groups: **this control for other factors that may influence the DV**

Steps:

- t_1 : Pre-tests
- t_2 : Stimolous for the treatment-group
- t_3 : Post-test
- Pre-tests further reduce the risks of extraneous factors influencing the results

Experiments vs Quasi-Experiments

Problems:

- Biases coming from the Supply/Demand

Experiments vs Quasi-Experiments

Problems:

- Biases coming from the Supply/Demand
- Threat to internal validity (Intra/inter session history, performance effect, mortality)

Experiments vs Quasi-Experiments

Problems:

- Biases coming from the Supply/Demand
- Threat to internal validity (Intra/inter session history, performance effect, mortality)
- External validity!

Experiments vs Quasi-Experiments

Problems:

- Biases coming from the Supply/Demand
- Threat to internal validity (Intra/inter session history, performance effect, mortality)
- External validity!
 - Unrepresentative treatment group of the population

Experiments vs Quasi-Experiments

Problems:

- Biases coming from the Supply/Demand
- Threat to internal validity (Intra/inter session history, performance effect, mortality)
- External validity!
 - Unrepresentative treatment group of the population
 - The effect of the treatment might differ depending on the setting (lab vs real life)

Experiments vs Quasi-Experiments

Problems:

- Biases coming from the Supply/Demand
- Threat to internal validity (Intra/inter session history, performance effect, mortality)
- External validity!
 - Unrepresentative treatment group of the population
 - The effect of the treatment might differ depending on the setting (lab vs real life)
 - The effect of the treatment may differ over time

Experiments vs Quasi-Experiments

Problems:

- Biases coming from the Supply/Demand
- Threat to internal validity (Intra/inter session history, performance effect, mortality)
- External validity!
 - Unrepresentative treatment group of the population
 - The effect of the treatment might differ depending on the setting (lab vs real life)
 - The effect of the treatment may differ over time

NB: Ethical considerations are always needed!

Experiments vs Quasi-Experiments

- In the real world, and particularly in some areas of research, random assignment is not always possible!

Experiments vs Quasi-Experiments

- In the real world, and particularly in some areas of research, random assignment is not always possible!
- We then take advantage of situations occurring naturally that correct for issues of internal and external validity

Experiments vs Quasi-Experiments

- In the real world, and particularly in some areas of research, random assignment is not always possible!
- We then take advantage of situations occurring naturally that correct for issues of internal and external validity
- Many approaches:
 - Difference in differences

Experiments vs Quasi-Experiments

- In the real world, and particularly in some areas of research, random assignment is not always possible!
- We then take advantage of situations occurring naturally that correct for issues of internal and external validity
- Many approaches:
 - Difference in differences
 - Natural experiments

Experiments vs Quasi-Experiments

- In the real world, and particularly in some areas of research, random assignment is not always possible!
- We then take advantage of situations occurring naturally that correct for issues of internal and external validity
- Many approaches:
 - Difference in differences
 - Natural experiments
 - Instrumental variables

Experiments vs Quasi-Experiments

- In the real world, and particularly in some areas of research, random assignment is not always possible!
- We then take advantage of situations occurring naturally that correct for issues of internal and external validity
- Many approaches:
 - Difference in differences
 - Natural experiments
 - Instrumental variables
 - Regression-discontinuity designs

Q&A

Questions? Doubts?

RD Challenge

Research Design Challenge!

Team up with your colleagues and download the following dataset from James D. Fearon and David D. Laitin, "Ethnicity, Insurgency, and Civil War," American Political Science Review 97, 1 (March 2003): 75-90.

- `https://tinyurl.com/method-conflict`

1. Let's look at the data
